

Rocket Words

vibration	Particles moving very quickly
medium	A substance such as air, water or a solid
energy	The power to make something work, move or grow
materials	Anything used in making something or building
reflect	Bounce back from a surface
volume	How loud or quiet a sound is
decibels	The unit to measure loudness
pitch	How high or low a sound is
instruments	Objects used to play music
particles	Tiny pieces that make up something larger
sound source	The object that started the sound

Pitch

The pitch of a sound is how high or **low** it is. A squeak of mouse has a high pitch A roar of a lion has a low pitch.

A high pitch sound is made because it has a high frequency. The sound source vibrates many times a second.

How do we hear?

The sound waves travel to the ear and make the eardrums vibrate. Messages are sent to the brain which recognises the vibrations as sounds.

Volume

The volume of a sound is how **loud** or **quiet** it is. Quieter sounds have a smaller **amplitude** and less energy (**smaller vibrations**) and louder sounds have a bigger amplitude and more energy. The **closer** we are to a sound source the louder it will be. A train arriving at a station sounds loud. The further away from a sound the fainter it will be. A train in the distance sounds quieter.

How sounds are made and travel

When objects vibrate, a sound is made. The vibration makes the air around the object vibrate and the air vibrations enter your ear. These are called sound waves. If an object is making a sound, a part of it is vibrating, even if you cannot see the vibrations. Sound waves travel through a medium (such as air, water, glass, stone, and brick).
